Excerpt from *Appendicitis: Its History, Anatomy, Clinical Ætiology, Pathology, Symptomatology, Diagnosis, Treatment, Technic of Operation, Complications and Sequels*

On the appearance of the last edition it seemed that the field of appendicitis had been so thoroughly tilled that there was small chance for further growth. That such was not the case is best evidenced by the fact that it has been found necessary practically to re-write sections of the book. In doing this the intensely practical nature of the subject has been kept uppermost in mind, the chief objects being to portray the disease in its clinical aspects for the benefit of student and practitioner whose opportunities for extensive special experience are necessarily limited, and to advocate those methods of treatment which the personal experience and unabated interest of years have led the author to believe to be most salutary. The recent advances in the treatment of peritonitis in general, and of appendicular peritonitis in particular, have necessitated entire revision of that important subject with explicit formulation of our present views.

The importance of chronic appendicitis has increased during the past few years and its various and obscure clinical manifestations have been more clearly delineated. The place and meaning of the leukocyte count and the differential formula have continued to provoke discussion and are nearer solution. Lane's bands, Jackson's membrane and the mobile cæcum have successively been invoked to account for symptoms commonly ascribed to chronic appendicitis which in some cases are not abolished by removal of the appendix. The extent to which they are a factor is still a question of interest.

We have wished to make little change in the chapter on Pathology from the Master hand of the late Dr. A. O. J. Kelly, but few additions or erasures having been found necessary. Increasing experience has made it possible to add a more adequate discussion of carcinoma of the appendix.
